

README for “Present Bias Unconstrained: Consumption, Welfare, and the Present-Bias Dilemma”

Overview

This replication package provides the Matlab code needed to reproduce the results in Supplementary Material Appendices E and F of the article.

Data Availability and Provenance Statements

- No external datasets were used. However, the code provided here draws heavily from the codes provided on Benjamin Moll’s website: <https://benjaminmoll.com/codes/>
 - It also uses the LCP code from Yuval Tassa available here: <http://www.mathworks.com/matlabcentral/fileexchange/20952>

Computational Requirements

Software Requirements

- Matlab (code was run with Matlab release 2023b)

Memory and Runtime Requirements

- This code was run on an 8-core Intel-based PC with 320GB of RAM
- Each iteration of the model takes less than 2 minutes to solve

Appendix E: Description of Matlab Programs

- Run `main_2Huggett.m` to solve the model
 - The program is set up so that it runs the exponential ($\beta = 1$) calibration
 - To run the other calibration cases, the variable `presentBias` needs to be changed (further details provided below)
- Once all three calibration cases have been run and saved in the output directory (saving is automatic), run `plotOutput_2Huggett.m` to produce the tables/figures in Appendix E
 - The ‘main’ code saves Matlab workspaces (.mat) to the output directory
 - The ‘plotOutput’ code saves figures to the `figs` directory
- The subfunctions directory contains additional Matlab scripts that are used when solving the model

Appendix F: Description of Matlab Programs

- Run wrapper.m to solve the model
 - The program is set up so that it runs both the $rCC = 30\%$ and $rCC = 15\%$ cases, and then plots the relevant output
 - The ‘wrapper’ code saves figures to the figs directory
- The ‘wrapper’ file calls model_calib.m and solve_HJB.m, which are used when solving the model

Appendix E: Instructions to Replicators

- The file main_2Huggett.m needs to be run 3 separate times, changing the variable presentBias each time. The following order is recommended:
 - presentBias = 0 (Exponential Case)
 - presentBias = 1 (Sophisticated Present-Bias Case)
 - presentBias = 2 (Naive Present-Bias Case)
- Once those 3 iterations of main_2Huggett.m have been run and the output saved, then the code plotOutput_2Huggett.m will produce the tables/figures used in Appendix E
 - The data for Table 1 is saved with the model output: see variable wealthDistStats

Appendix F: Instructions to Replicators

- Running the file wrapper.m will produce the figures used in Appendix F

List of Tables and Programs

The tables/figures in Appendices E and F can be reproduced based on the instructions above
